ICT as Basic National Policy:
Building Solid Foundations for the Arab Digital Society

The power of digitalization for a better and sustainable future has been widely proven all over the world. Governments and industry need to work together, hand-in-hand, to devise strategies for driving the roll-out of these networks much more proactively. Connecting people not only brings them closer to the digital society and makes them feel better, but also gives them a tool to build a better future. Digitalization touches the everyday lives of all people by meeting their basic needs in more intelligent ways, through digital services such as e-Education, e-Government, e-Health, e-Commerce and IOT services such as Smart Security, Smart Metering, Smart Energy and Smart Agriculture etc. Mobile Money has recently emerged as a critical application for unbanked populations by allowing easy and convenient access to financial services. Universal broadband coverage with its multiple applications and services is the foundation of digitalization for the building of the new Arab digital society.
